N-iodosuccinimide and the 7-iodo deriv. was de-O-methylated, oxidized to the sulfoxide and ammonolyzed, and detritylated to give azaguanosine IV (R = NH2, R1 = iodo, R4 = Q, R5-R8 = H). This was coupled with HC≡CCH2NHCOCF3 in the presence of (Ph3P)4Pd/CuI catalyst and the product converted to the triphosphate and deprotected to give IV (R = NH2, R1 = H2NCH2C≡C, R4 = Q, R5 = H4P3O9, R6-R8 = H). This was condensed with a xanthene deriv. (prepn. given) to give fluorescent chain terminator V.

AB A fluorescence-based system for **DNA** sequence anal. is described. A set of fluorescence-labeled **DNA** chain terminators was generated. Each of the 4 chain terminators corresponding to the 4 nucleotide basis in **DNA** carries a different fluorescent compd. **DNA** fragments to be sequenced can be labeled with these fluorescent compds. in a single vessel. The labeled **DNA** fragments of varying lengths are then sepd. by electrophoresis. A photometric detection system is used to identify the labeled bases and det. the **DNA** sequence.

AB A very mild and efficient procedure has been developed for the prepn. of C-5 substituted deoxyuridines. The substituent carries a masked primary aliph. amino group. These compds. are readily converted into their phosphoramidites and can be used to prep. oligonucleotides carrying one or more aliph. amino groups. Fluorescein isothiocyanate coupled to these compds. gives oligonucleotide probes carrying multiple fluorescein labels. These compds. have a free 5'-hydroxy group enabling additional 5'- end radioactive labeling for evaluation of their hybridization characteristics. Oligonucleotides carrying a long (11 atom) linker arm to the fluorescein hybridize more efficiently to mRNA than those carrying a short (4 atom) arm. The long linker arm derivs. are comparable to underivatized oligonucleotides in hybridizing to mRNA.
